摘要 目的:探讨红细胞分布宽度(RDW)与阵发性非瓣膜性心房颤动(房颤)导管射频消融后复发的关系。方法:入选阵发性非瓣膜性房颤患者73例,均首次行环肺静脉消融术。收集所有患者的RDW、房颤病程、血清非结合胆红素水平、总胆红素水平、左房直径的临床数据。设定术后3个月为空白期。平均随访(17±15)个月。复发定义为术后3个月发生的持续时间>30s的快速房性心律失常,包括房速、房扑、房颤。采用多元Logistic回归分析RDW与复发的关系。结果:房颤复发24例、未复发49例,复发组患者术前RDW、左房直径、房颤病程、间接胆红素、总胆红素均高于未复发组($P<0.05$),经多元Logistics回归显示,左房直径、房颤病程、RDW是房颤消融术后复发的独立危险因素。结论:RDW增高、左房直径增大、房颤病程延长与阵发性非瓣膜性房颤患者导管射频消融后复发有关。

Abstract Objective: To investigate the association between red cell distribution width (RDW) and atrial fibrillation recurrence after radiofrequency catheter ablation in patients with paroxysmal non-valvular atrial fibrillation. **Methods:** 73 patients with paroxysmal non-valvular atrial fibrillation that undergoing ring pulmonary vein radiofrequency catheter ablation were included. RDW, course of atrial fibrillation, left atrium diameter, unconjugated bilirubin, total bilirubin of all patients were carefully collected. Three months after the operation for the blank period was set up. The average follow-up period was (17±15) months. Recurrence was defined as recurrence of atrial fibrillation, atrial flutter, atrial tachycardia which lasted >30 s. Statistic data were analyzed by multiple Logistic regression. **Results:** Twenty-four patients had atrial fibrillation recurrence relapse. Recurrence group had higher preoperative RDW, bigger left atrial diameter, longer course of atrial fibrillation, higher unconjugated bilirubin, total bilirubin than non-recurrence group ($P<0.05$). Multivariate Logistic regression analysis showed that left atrial diameter, course of disease, RDW were independent risk factors for atrial fibrillation recurrence after radiofrequency catheter ablation. **Conclusion:** Left atrial diameter, course of atrial fibrillation, and RDW could be associated with recurrence of atrial fibrillation after radiofrequency catheter ablation in patients with paroxysmal non-valvular atrial fibrillation.

Key words atrial fibrillation; red cell distribution width; radiofrequency ablation; recurrence

红细胞分布宽度 (red cell distribution width, RDW)是反映外周血红细胞体积异质性的参数,通常以红细胞体积大小的变异系数来表示,临床上多用于缺铁性贫血的诊断和鉴别诊断。近年来研究发现, RDW增高与心功能衰竭^[1]、冠心病、脑卒中^[2]及肺动脉高压患者的死亡密切相关,可能是一种新的心血管疾病危险标记物^[3]。然而,关于RDW与阵发性心房颤动(房颤)射频消融术后复发的关系研究

甚少。本研究对RDW与阵发性房颤患者射频消融术后复发的关系进行探讨。

1 资料与方法

1.1 临床资料 2011年1月-2014年12月在本院心内科因阵发性非瓣膜性房颤接受射频消融治疗的住院患者共104例,均为第1次行射频消融治疗的症状性房颤患者,且资料完整。排除标准:急性感染或慢性感染急性加重期、严重肝肾功能障碍、甲状腺功能亢进等甲状腺疾病、随访期间发生死亡、血红蛋白<100 g/L。符合以上标准的73例患者完成

作者简介 李宏亮(1989-),男,硕士在读,研究方向:心血管疾病的基础与临床;通信作者:李广平, E-mail: tjcardiol@126.com。

随访,男 44 例、女 29 例,年龄(62 ± 9)岁,病程(6.5 ± 6.0)年,合并心房扑动(房扑)及房性心动过速(房速)9 例、预激综合征 1 例、病态窦房结综合征 1 例、高血压 42 例、冠心病 25 例、2 型糖尿病 18 例,既往有脑卒中病史 5 例。

1.2 射频消融 患者常规开放静脉通道,芬太尼 0.5 mg 加安定 10 mg 经生理盐水稀释至 50 mL 后静脉恒速泵入($5\sim 8$ mL/h),必要时给予负荷量 2~5 mL。在三维电解剖标测系统(CARTO 或 EnsiteNavx)指导下,行肺静脉环形消融电隔离术,预设温度 43℃。放电时生理盐水输入速度 17 mL/h。每点消融 30~40 s 至局部心房电位振幅下降 80%或呈现双电位,逐点连接成线,达到肺静脉电位完全消失且至少 30 min 无复发,左心房-肺静脉传导双向阻滞。完成消融线路,对术中经消融不能终止房颤的患者进行同步直流电复律。术中 30~60 min 监测激活的凝血酶原时间,调整肝素用量,维持凝血酶原时间 250~350 s。

1.3 观察指标 患者均于入院次日晨空腹采集肘静脉血 2 mL,采用全自动血细胞分析仪测定 RDW,用全自动生化分析仪测定非结合胆红素、总胆红素水平。术前采用心脏彩超测定左房直径。术后随访,设定术后 3 个月为空白期,3 个月后开始至研究结束随访患者的复发情况,患者出现持续时间>30 s 的房颤、房扑、房速为复发。

1.4 统计学方法 采用 SPSS22.0 统计软件。计量资料用 $\bar{x}\pm s$ 表示,组间比较采用 t 检验;采用多变量 Logistic 回归分析消融术后复发的危险因素。 $P<0.05$ 为差异有统计学意义。

2 结果

73 例患者术后平均随访(17 ± 15)个月。术后 3 个月房颤复发 24 例(复发组),未复发 49 例(未复发组)。房颤复发组 RDW、左房直径、房颤病程、非结合胆红素、总胆红素明显高于未复发组($P<0.05$),见表 1。经多变量 Logistic 回归分析显示,RDW、左房直径、病程是房颤消融术后复发的独立危险因素($P<0.05$),见表 2。

3 讨论

2007 年 Felker 等^[5]首次发现心力衰竭患者的 RDW 明显升高,且是预后的独立危险指标^[6]。更高基线的 RDW 水平可以预测冠状动脉搭桥术后患者房颤的发生^[7],是阵发性房颤的独立预测分子^[8]。一项为 27 124 例患者大型研究^[9]结果表明,RDW 处在后 25%的人群比处在在前 25%的人群房颤的发生率高 33%。越来越多的证据表明,炎症和氧化应激在房颤的发生发展过程中具有重要作用^[10-12]。外周血中高 RDW 水平反映激活的应激(炎症)状态^[13-14]。在体快速心房起搏狗的模型研究表明,在房颤的背景下,RDW 与炎症、氧化应激水平有潜在的联系^[15]。房颤消融术后复发组 RDW 增高反映了慢性炎症可能是其共同的病理过程。炎性细胞因子可使骨髓红系干细胞对促红细胞生成素刺激不敏感,阻止其抗细胞凋亡和促进细胞成熟的作用。炎症因子抑制红细胞的成熟,导致未成熟红细胞进入循环,使红细胞大小异质性增加而 RDW 水平升高^[16];增高的 RDW 还可能与慢性炎症导致的红细胞无效生成有关。其次,RDW 增加,红细胞的可变形性降低,使得微循环血流通过受损,进而导致缺氧,诱发或加重了房颤患者机体的炎症状态。因此,RDW 升高可作为预测房颤消融术后复发的独立危险因素。本研究发现,复发组术前 RDW 水平比未复发组明显增大,经 Logistic 回归分析显示,RDW 是房颤消融术后复发的独立危险因素。

目前很多文献提到左房增大、房颤病程是房颤消融术后复发的独立危险因素。本研究通过多因素分析亦发现左房增大、房颤病程是房颤消融术后复发的独立危险因素。研究表明,胆红素在人体内具有很强的抗氧化作用,本研究中,复发组的非结合胆红素水平明显高于对照组,但在 Logistic 回归分析中非结合胆红素水平增高无明显意义。推测原因可能为氧化应激促进房颤的发生,而胆红素作为一种抗氧化应激因子,为了平衡体内的氧化和抗氧化而代偿性升高。

综上所述, RDW 是房颤射频消融术后复发的独立危险因素。本研究样本小, 没有评估其他炎性标记物对房颤消融术后复发的影响, 需进一步研究探讨。

是其出血风险较高, 尤其对于高龄患者, 因此在临床实践工作中更应该注重预防血栓的发生, 改善内皮细胞功能, 阻止血栓形成的关键步骤, 从而减少 AF 患者血栓的形成。
